PERIODICAL: Zavodskaya Laboratoriya, 1957, Vol. 23, Nr 8, pp. 1002-1004 (USSR)

ABSTRACT: Dmitrieyv, P.P. (Tashkentskiy khimicheskiy institut Akademii nauk UzSSR) suggested an alteration in the already known apparatus for oil-refining and determining the effective boiling points of mineral oil products according to Badgadzher in that the separation of the fractions does not take place in the Kleisen-pistons but in the apparatus itself, which permits a reduction of the time needed for the experiment, the elimination of losses and greater accuracy. There are 2 figures.

Krishtul, V.P. and Paskutskaya, L.N. (Akademiya kommunal'nogo khozyastva) suggested a kind of water jet-sucking pump to be used for emptying the vessels after the experiments are finished, which is assumed to offer technical-practical advantages. There is 1 figure.

Skopin, Yu.A. (Kazakhskiy sel'skakhozyaystvennyy institut) suggested a device for gas washing which offers the advantage that the washing liquid can be used without shutting off the gas and in which the gas washing process takes place between the bottoms of two telescoped vessels. There is 1 figure.

Short Reports

Korshunov, V.I. (Institut goryuchikh iskopayemykh Akademii nauk SSSR) suggested an apparatus for the fraction analysis of dispersive minerals. The apparatus consists of a cylindric vessel the lower end of which forms a cone and is connected to a tube where a straight-way cock is provided. At the side, in the middle of the cylinder, there is a feeder through which the fine-grained mineral is fed, mixed with a liquid which has approximately the same specific weight. The lighter fractions, which rise up are caught by the channel provided above; the heavier ones, which are deposited below, are eliminated by the straight-way cock.

Simonyan, A.A. (Moskovskiy torfyanoy institut) suggested an apparatus for the determination of the maximum of the shearing stress and the coefficients of the lateral pressure of the plastic materials (chalk, peat, etc.). The apparatus consists of a horizontally fixed tube of several parts which can easily be dissembled into its individual parts and has inside a thread-like cut which prevents the displacement of the material it contains. One of the branches of the tube has an inductor for measuring the lateral pressure. The pressure is caused by a piston, which is introduced into the tube. The other end of the tube is fitted with a closing device. The number of the parts of the tube is reduced by dismantling them as required. Examples of application, 1 figure.

Short Reports

32-8-53/61

Chernetsov, M.M. (Moskovskiy lesotekhnicheskiy institut) worked out the method for the production of the prescribed wooden samples for the examination of the maximum of the lateral extension of the wood: in this case a specially steel sample is used. 1 figure.

Funke, V.F. (Vsesoyuznyy nauchno-issledovatel'skiy institut tverdykh splavov) suggested a scheme of a furnace for the hardening of the samples at temperatures of up to 1600°. Heating takes place here in a neutral sheltered atmosphere and is regulated by the autotransformer. Examples of application are given. There is 1 figure.

TEXT: The authors give brief data on the results of investigations concerning the selection of varnish and paint protections for the open-air sections of the Bukhara-Sverdlovsk pipeline. The following variants were chosen for experimental sections on the basis of preliminary laboratory tests: two layers of ПВХ-714 (PVKh-714) enamel on a prime coat of ФЛ-013 (FL-013) or ФЛ-03К (FL-03K) or ФХГМ (FKhGM); one layer of ground coat Э-4020 (E-4020); two layers of ХВ-113 (KhV-113) varnish with aluminum powder (10-15%) on a ВХГМ (VKhGM) prime coat. [Abstracter's note: The original writes PVKh-714 and PKhV-714 alternately. Since a PVC coat is assumed, the version PVKh-714 was chosen.] A two- or three-

TITLE:

Increase of the thermal stability of polyethylen-insulated
lines by ionizing radiation

SOURCE:

Tashkentskaya konferentsiya po mirnym ispol'zovaniyu
atomnoy energii. Tashkent, 1959. Trudy. v. 1. Tashkent,
1961, 383-389

TEXT: A copper wire 1 mm in diameter and insulated with 0.5 mm of
polyethylene was irradiated by a Co⁶⁰ gamma radiation source of
20,000 g-equ. Ra in a vacuum as well as by an electron linear accelerator
in the air. The thermal stability of the irradiated samples was deter-
mined by the analysis of the thermomechanical curves, i.e., of the time
dependence of deformation under given load and with the temperature rising
by a constant rate of 50 deg/hr, using a specially built device. The
deformation that was attained is a measure of thermal stability at given
temperature and load. The lifetime of the workpiece can be estimated from
Card 1/4

Increase of the thermal stability ...

the time dependence of deformation (likewise measurable by the above-mentioned device) at constant temperature and load. At increased temperatures the deformation is the lower, the higher the radiation dose, and remains practically constant up to 250°C. The restriction of deformation under a load of 0.5 kg to about half the radial thickness by irradiation with doses of 100-150 Mrad or by irradiation with 1-Mev ($15 \mu\text{a}/\text{cm}^2$) electrons for 2-4 min guarantees the usability of lines above 80°C. The final deformation is increased by a load increase without any change of its nature. The line still remains efficient if the load is quadrupled. The amount of final deformation is not affected by the rate of temperature increase over a wide range. The deformation is only little temperature-dependent under both long and brief load action. A line with irradiated insulation can be exposed to 180°C for at least 4 hrs, and remains efficient for some hours even at 230-250°C. If suitable stabilizers are introduced into polyethylene, the maximum operating time in this temperature range can probably be increased considerably, and the line can be exposed to even higher temperatures for a short time. The increased thermal stability improves the reliability of insulated wires at high temperatures, especially in the case of breakdown, and increases

Increase of the thermal stability ...

the operating time at normal temperatures. Gamma irradiation in vacuo increases the stability at 20° and 90°C, while doses of more than 200 Mrad. reduce it. The irradiation of 0.4 mm thick samples in the air reduces the relative elongation and also the tensile strength at 20° and 90°. The best strength properties are achieved by irradiation in vacuo with doses of up to 100 Mrad. The tensile strength of an insulation irradiated with fast electrons are presented in Table 1. Tensile strength, resistance to frost, electric breakdown and electrical resistance of a sample irradiated with a gamma dose of 100 Mrad or, equivalently, with 1-Mv electrons for 2-4 min were fully satisfactory. The resistance of line insulation to thermal aging drops with increasing radiation dose. Samples irradiated with electrons are more resistant in this respect than samples irradiated with an equivalent gamma dose. There are 6 figures, 6 tables, and 7 references: 5 Soviet and 2 non-Soviet. Translation from: Referativnyy zhurnal. Metallurgiya, 1958, Nr 12, p 181 (USSR) SOV/137-58-12-25354

AUTHORS: Moroz, L. S., Khesin, Yu. D., Mingin, T. E., Chernetsov, V. I.

TITLE: The Strength of Titanium (Prochnost' titana)

PERIODICAL: V sb.: Metallurgiya. Moscow-Leningrad, AN SSSR, 1957, pp 172-193

ABSTRACT: An investigation was made of the effect of low temperatures, rate and length of loading time, notching, and other external factors on the modulus of rupture of industrial Ti smelted in an electric-arc vacuum furnace. The authors discovered a sharp difference in sensitivity to notching (SN) in metals of separate smeltings which was determined by the ratio between the specific deformation work of impact stretching of smooth specimens and the α_k of notched Mesnager-type specimens. Ti which has a high SN is also sensitive to the state of the surface in notched specimens. The maximum H content of ~ 0.007 - 0.008% with which Ti retains a tolerable SN, but this figure may vary depending upon O and N content. The intensity of the effect of H on the α_k is determined by the size and type of TiH precipitation which depends upon the cooling rate from the temperature of > 400°C. Static

SOV/137-58-12-25354

The Strength of Titanium

bending tests of notched specimens showed that the magnitude of the bending deflection and the deformation work up to the appearance of the first crack, as well as the work of propagation of the crack through the entire section of the specimen at room temperature, are less in Ti than in SKhL-4 steel. In dynamic testing Ti with 0.0007% H exhibits no cold-brittleness whatever, but when affected by impurities, in particular by H, it becomes cold-brittle. An increase in H content to 0.0125% decreases ψ by 75% at -196°C . The authors advance a hypothesis to explain the physical nature of H-brittleness of Ti by the low S_{ot} of favorably oriented hydride inclusions. It was discovered that the strain rate has no effect on the ductility of smooth specimens of Ti enriched with H.

AUTHOR: Chernetsov, V. I., Engineer

TITLE: Influence of the Grain Size on the Mechanical Properties and the Notch Sensitivity of Commercially Pure Titanium

PERIODICAL: Metallovedeniye i termicheskaya obrabotka metallov, 1960, Nr 6, pp 40-42 + 1 plate (USSR)

ABSTRACT: The aim was to study the influence of the grain size on the mechanical properties and the notch sensitivity and to verify data in the literature on this question. Ingots of commercially pure titanium were cut into blanks 35 x 35 x 227 mm. For eliminating hydrogen the material was annealed for 5 hours in a vacuum furnace at 950°C; after vacuum annealing the metal still contained 0.0017% H, 0.042% N, 0.075% O. To obtain a fine grain the blanks were rolled at 400°C, the rolled 14 x 14 mm rods were heated for 1 hour at 700°C and then quenched in water. Then the metal had the following mechanical properties: $\sigma_b = 70.6 \text{ kg/mm}^2$, $\sigma_s = 51.4 \text{ kg/mm}^2$, $\delta = 27\%$, $\psi = 43.4\%$ and HB 200 kg/mm^2 . Coarser grain was

Notch Sensitivity of Commercially Pure Titanium

produced by heating in a vacuum furnace in order to exclude saturation of the metal with oxygen, nitrogen and hydrogen. The micro- and macrostructure at various annealing temperatures is shown in the photographs reproduced in Fig 1 (plate). The grain size was determined by counting the number of crystallites on a cut at a magnification of 100 for the temperatures 750 to 900°C and at a magnification of 10 for the temperatures 950 to 1100°C. The average data of the measurements are entered in Table 1 for a test temperature of 20°C. The dependence of the grain size on the temperature of vacuum annealing is plotted in Fig 2; data on the influence of the grain size on the mechanical properties are entered in Table 2. Fig 3 shows a plot of the dependence of the impact strength on grain size at the test temperatures +20 and -196°C.

Card 2/3

TITLE: Effect of scale and temperature factors on the impact strength of plastics

SOURCE: Mekanika polimerov, no. 5, 1965, 151-153

TOPIC TAGS: thermosetting material, thermoplastic material, plastic strength, impact strength, temperature factor, mechanical stress, scale factor

ABSTRACT: Experimental investigations of the mechanical characteristics of certain thermosetting plastics¹⁵ show the indubitable effect of scale and temperature factors on the impact strength of plastics. It has been found that the specific impact strength of the AG-4V plastic material increases (up to T=1400C) with an increase in temperature and then sharply declines to its value at T=20C when the size of sample taken is one fifth of the State Standard size and when the temperature of heating is increased from 20 to 200C. Under similar conditions the plastic SNK-2-27¹⁵ manifests directly opposite behavior. The AG-4V plastic is more sensitive both to decrease in size and increase in the temperature of heating. Orig. art. has: 3 figures and 2 formulas. [Based on author's abstract]

Title : The Clinical Course of Fibromyomas in Relationship to their
Histological Structure.

Orig Pub : Sb. tr. Kurskiy med. in-t, 1956, vyp. 11, 138-142

Abstract : In clinical and histological studies of 30 patients with
uterine fibromyomas, the author found that the mucosa of
these patients contained argentaphile fibers located around
the glands and blood vessels, that in 77 percent of the cases
there was development of connective tissue and in 23 percent
there was development of muscle tissue; in the tumors in which
the connective tissue predominated there was a hardening
of the basic argentaphile substance and a transformation of
the precollagen into collagen fibers (in the tumors with pre-
dominant muscle tissue collagenization was not observed);

Title : The Course of Carcinoma of the Uterus in Relation to Age.

Orig Pub : Sb. tr. Kurskiy med. in-t, 1956, vyp. 11, 136-137

Abstract : Carcinoma of the cervix was found in 27 of 556 patients below 30 years of age. The cure rate comprised 33% in this group. The cure rate in 30-50 age group comprised 39.3%. Only 51 (27%) of 189 patients over 60 years of age were operable, but only 22 of these were subjected to surgery. Only one remained alive after 5 years of combined treatment. The author recommends that old patients be subjected to X-ray treatment.

TITLE: Barograph and Barogram

PERIODICAL: Grazhdanskaya Aviatsiya, 1960, No. 6, p. 21.

TEXT: The author points out that local flights airliners are frequently starting with unsealed barographs and used barograms. This is due to the shortness of route, preoccupation of the aircraft technician and also to shortcomings of the AD-2 (AD-2)⁷ barograph.⁷ This type of barograph is too bulky, suspender springs snap frequently and distort recorded data.

TITLE: Real part of the pn scattering amplitude in the energy interval 2-10 Gev

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu. Prilozheniya, v. 3, no. 1, 1966, 15-21

TOPIC TAGS: proton scattering, neutron scattering, scattering amplitude, differential cross section, deuteron reaction

ABSTRACT: On the basis of experimental data obtained by the authors on elastic pd scattering in the energy interval 1-10 Gev, and information on pp scattering amplitude in this energy range, the authors determined the real part of the scattering

Card 1/2

L 24301-66

ACC NR: AP6006795

amplitude by means of an experiment involving registration of slow recoil deuterons from a film target of deuterated polyethylene 0.5--0.6 μ thick. The investigated range of the squared momentum transfer was $0.003 < |t| < 0.2$ (Gev/c)². Plots are presented of the differential cross sections vs. the square of the momentum transfer and an empirical formula is given for these plots. The value obtained for the total cross section of elastic pd scattering at 6 Gev is several times smaller than that measured by others. In the small-angle region of pd scattering, constructive interferences were observed between the Coulomb and nuclear scatterings. From the obtained real part of the pd scattering amplitude, and from a comparison of the obtained data with earlier measurements by the authors of the pp scattering amplitude of the same energies (ZBETF v. 50, 76, 1966), the estimated real part of the pn scattering amplitude is +0.2, -0.06, -0.45, and -0.40 for 2, 6, 8, and 10 Gev respectively. The small nonzero real part of the pn scattering amplitude agrees with data obtained at CERN (G. Bellettini et al., Internat. Conf on Elementary Particles, Oxford, 1965). Orig. art. has: 2 figures, 3 formulas, and 2 tables.

L 22122-66

ACC NR: AP6004922

ABSTRACT: This is a continuation of earlier work by the authors (Phys. Lett. v. 13, 93, 1964) in which they present results of the measurements of the real part of the nuclear elastic scattering amplitude for an energy of 4 Gev, and more precise data for energies 2, 6, 8, and 10 Gev, taking into account the relativistic corrections. The experimental technique was described elsewhere (PTE no. 6, 18, 1963). The differential cross section was measured in the interval $0.003 < |t| < 0.2$ (Gev/c^2) (t = momentum transfer squared). The analysis of the obtained data as well as those reported by others was based on the Bethe formula (Ann. of Phys. v. 3, 190, 1958) with allowance for radiative corrections. The results agree well with the theoretical curve proposed by Soding (Phys. Lett. v. 8, 286, 1963), up to an energy of 20 Gev, above which some discrepancy appears. Orig. art. has: 1 figure and 2 formulas.

Title : Repair of cracked diesel pistons

Periodical : Energ. Byul., 6, 27-28, Je 1955

Abstract : Piston head cracks measuring 50-280 mm in the Baldwin diesel (6 cylinders, 4 cycle, 590 HP and 500 rpm) can now be successfully repaired by a method described by the author. This consists of drilling through a hole whose diameter is greater than the crack length, threading it and fitting it with threaded steel plug. Two sketches to illustrate the method are attached. Editors of this periodical inserted their approbation to the described method in preference to the pistons repair by welding.

TITLE: The Ventilation of Electric Motors of 3-6 kv in Boiler Rooms of Electric Power Plants (Ventilyatsiya elektrosvigateley 3-6 kv v kotel'nykh elektrostantsiy)

PERIODICAL: Energetik, 1958, Nr 8, pp 8-10 (USSR)

ABSTRACT: The "Teploelektroprojekt" Institute has carried out a study of the effect of ventilation on the working performance of 3-6 kv electric motors in the boiler houses of power plants. In some plants natural ventilation was used, the motor drawing air from around the boilers in the boiler house; in others the motors were enclosed and drew air from outside through a pipe. It was found that the natural ventilation system led to abnormally high working temperatures since the air was drawn from around the boilers. Still worse, the coal dust, often present in the air, clogged the motors, caused breakdowns, destroyed the insulation, necessitated more frequent repair and cleaning, and led to rapid wear of

Card 1/2

TITLE: Elastic proton-proton scattering under small angles at 6.2-Bev
energy

PERIODICAL: Referativnyy zhurnal, Fizika, no. 6, 1962, 29, abstract 6B207
("Dokl. Bolg. AN", 1961, v. 14, no. 5, 443 - 446, English summary)

TEXT: Elastic p-p scattering at 6.2-Bev energy under angles of $1^{\circ}.2$ -
 $11^{\circ}.5$ in the center-of-mass system has been studied using a photoemulsion chamber
irradiated by the internal proton beam of the ОИЯИ (OYIaI) proton synchrotron.
An irradiation geometry has been used, in which the incident flux is perpendi-
cular to the plane of the emulsion layers. This experimental arrangement permits
the efficient recording of p-p scattering down to very small angles, and a
reliable singling out of background events. In all, 141 cases of elastic p-p
scattering have been singled out. The results are compared with the differential
section under zero angle, calculated by the optical theorem using the full sec-

tion of p-p interaction. Conclusions on the presence of a real part in the scattering amplitude or on its dependence on the spin state will be possible only after the statistical basis has been extended.

TOPIC TAGS: proton-proton scattering, elastic, emulsion technique, perpendicular irradiation

ABSTRACT: Elastic p-p scattering at 6.2 BeV was measured by perpendicular irradiation of nuclear emulsions which yields the required information more rapidly than the usual parallel irradiation when the differential cross sections for high-energy elastic scattering is measured at small angles (up to 1° in the center of mass system). The differential cross section was obtained for the $1.3 - 10.5^\circ$ c.m.s. range. The results, together with the data obtained by the authors elsewhere (Zhurnal eksperimental'noy i teoreticheskoy fiziki, vol. 37, 910, 1959, and vol. 38, 1471, 1960), together with the results of Corr, Wentzel, and Causey (Phys. Rev. vol. 107, 859, 1957), cover the broad c.m.s. range $1.3 - 10.5^\circ$.
